Advanced Video Coding

From Wikipedia, the free encyclopedia

"AVC1" redirects here. It is not to be confused with AV1 or VC-1.

Advanced Video Coding (AVC), also referred to as **H.264** or **MPEG-4 Part 10, Advanced Video Coding (MPEG-4 AVC)**, is a [video compression standard](#) based on block-oriented, [motion-compensated integer-DCT coding](#).^[1] It is by far the most commonly used format for the recording, compression, and distribution of video content, used by 91% of video industry developers as of September 2019.^{[2][3][4]} It supports resolutions up to and including [8K UHD](#).^{[5][6]}

Multimedia

| | |
|----------------|---|
| Audio Features | Loudspeaker, FM Radio, 3.5mm Port |
| Audio Formats | AAC, 3GA, AMR, RA, FLAC, MID, MIDI, MP3, OGA, OGG, WMA, WAV |
| Video Formats | H.263, H.264, MPEG-4, MP4, XVID |
| Sensors | Proximity, Accelerometer, Compass, Gyroscope, Fingerprint, GPS, / GLONASS, BeiDou |

1. A video encoding system comprising:

a visual perception estimator adapted to estimate a perception threshold for a pixel of a current frame of a videostream;

an encoder adapted to encode said current frame;

a compression dependent threshold estimator adapted to estimate a compression dependent threshold for said pixel at least from said perception threshold and information from said encoder; and

a filter unit adapted to filter said pixel at least according to said compression dependent threshold.

Claim 1

https://www.gsmarena.com/motorola_moto_g7_power-review-1889p5.php

A video
encoding
system
comprising:

...

Videos shot on the Motorola G7 Power in 4K and 1080p resolution at 30 fps get saved in a rather standard configuration of a 17-ish Mbps AVC video feed and a 48kHz stereo AAC audio track, inside an MP4 container. The frame rate remains pretty steady at 30 fps.

Quality is actually quite good with plenty of detail for the class, high contrast, and lively colors. The dynamic range is about average.

| Claim 1 | |
|--|--|
| <p>A video encoding system comprising:</p> | <p>G7 Power records with H.264/AVC and “High Profile”:</p> <p>https://www.phonearena.com/phones/Motorola-Moto-G-Power_id11349</p>  <p>“High Definition” uses the H.264 “High Profile”: https://www.rgb.com/h264-profiles</p>  <p><u>H.264 High Profile is the most efficient and powerful profile in the H.264 family, and is the primary profile for broadcast and disc storage, particularly for HDTV and Bluray disc storage formats. It can achieve a compression ratio of about 2000:1. The High Profile also uses an adaptive transform that can select between 4x4 or 8x8-pixel blocks. For example, 4x4 blocks are used for portions of the picture that are dense with detail, while portions that have little detail are compressed using 8x8 blocks. The result is the preservation of video image quality while reducing network bandwidth requirements by up to 50 percent. By applying H.264 High Profile compression, a 1 Gbps stream can be compressed to about 512 Kbps.</u></p> |

Claim 1

a compression
dependent
threshold
estimator
adapted to
estimate a
compression
dependent
threshold for said
pixel at least from
said perception
threshold and
information from
said encoder;
and

The variables α' and β' depending on the values of indexA and indexB are specified in Table 8-16. Depending on chromaEdgeFlag, the corresponding threshold variables α and β are derived as follows.

- If chromaEdgeFlag is equal to 0,

$$\alpha = \alpha' * (1 \ll (\text{BitDepth}_Y - 8)) \quad (8-466)$$

$$\beta = \beta' * (1 \ll (\text{BitDepth}_Y - 8)) \quad (8-467)$$

- Otherwise (chromaEdgeFlag is equal to 1),

$$\alpha = \alpha' * (1 \ll (\text{BitDepth}_C - 8)) \quad (8-468)$$

$$\beta = \beta' * (1 \ll (\text{BitDepth}_C - 8)) \quad (8-469)$$

The variable filterSamplesFlag is derived by

$$\text{filterSamplesFlag} = \text{bS} \neq 0 \ \&\& \ \text{Abs}(p_0 - q_0) \leq \alpha \ \&\& \ \text{Abs}(p_1 - p_0) \leq \beta \ \&\& \ \text{Abs}(q_1 - q_0) \leq \beta \quad (8-470)$$

What is the Constant Rate Factor?

<https://slhck.info/video/2017/02/24/crf-guide.html>

The Constant Rate Factor (CRF) is the default quality (and rate control) setting for the x264 and x265 encoders, and it's also available for libvpx. With x264 and x265, you can set the values between 0 and 51 where lower values would result in better quality, at the expense of higher file sizes. Higher values mean more compression, but at some point you will notice the quality degradation.

https://www.itu.int/rec/dologin_pub.asp?lang=e&id=T-REC-H.264-200711-S!!PDF-E&type=items pg. 201

Let qP_{av} be a variable specifying an average quantisation parameter. It is derived as follows.

$$qP_{av} = (qP_p + qP_q + 1) \gg 1 \quad \dots \quad (8-463)$$

$$\text{indexA} = \text{Clip3}(0, 51, qP_{av} + \text{filterOffsetA}) \quad (8-464)$$
